Each year, approximately 4.8 million acres of soybean are harvested in the state of Ohio. For this vital crop, it is important to have proper pest management tools to identify pests, mitigate injury and assist with the pest management decision-making process.

Stink bugs are soybean pests that may decrease yield and quality significantly without proper management. Pest management of stink bugs involves correct identification and understanding the biology and scouting practices.
INTRODUCTION

This field guide was developed by The Ohio State University and the Soybean Checkoff to assist soybean producers and scouts identify and monitor stink bugs in Ohio. For more information about stink bugs in Ohio visit our website: aginsects.osu.edu

This field guide will discuss nine pest species including:

• Green stink bug
• Brown stink bug
• Dusky stink bug
• Onespotted stink bug
• Brown marmorated stink bug
• Redshouldered stink bug
• Rice stink bug
• Twice stabbed stink bug
• Say stink bug
In addition, two beneficial stink bugs are discussed that may be encountered:

- Spined shouldered bug
- Twospotted stink bug

These stink bugs are predators of crop pests and should not be included in calculations for monitoring and treatment.

For a more detailed review of stink bug biology and management, see the publication by Koch et al. 2017. Refer to page 35 for more details.

doi.org/10.1093/jipm/pmx004
Stink bugs belong to the insect order Hemiptera and family Pentatomidae. Stink bugs can be many different colors and variable sizes. Adults have a classic shield-shaped body that helps with identification.

Left to right: adult brown marmorated stink bug; yellow outline around stink bug shield highlighting the characteristic stink bug shape.
Stink bug eggs are barrel shaped with a ring of hairs on top of the egg. Typically, the eggs are laid on the underside of soybean leaves but can be found on other parts of the plant.

Stink bug eggs are a variety of colors, ranging from clear to pale green to tan, depending on the species of stink bug and the maturity of the eggs.
Immature stink bugs are called nymphs and they develop through 5 stages (called instars) before becoming adults. Nymphs are smaller and rounder than the adults, and lack fully developed wings thus cannot fly. In 4th and 5th instars small wing pads begin to form. Within a species, the different instars may vary in color.
Both adults and nymphs feed on soybean pods and seeds with their piercing-sucking mouthparts (a straw-like structure located on the underside of the stink bug). These mouthparts allow the insect to puncture the soybean pod and feed directly from the bean, resulting in shriveled, deformed, and discolored seeds. On pest species, the mouthparts are similar thickness to the antenna; whereas, beneficial species’ mouthparts are double the thickness of the antenna.
All life stages of stink bugs (nymphs and adults) can be present on soybean plants at the same time; however, early instars do not cause as much damage as the larger 5th instars and adults. Begin scouting for stink bugs when the soybean plant reaches the R2 stage. The R2 stage is defined as full bloom, which is when the plant has an open flower on one of the two upper-most nodes. Scouting should be performed once a week and continue throughout the season as pods develop and seeds fill. Stink bug feeding can cause economic loss from the R3 stage (pod set) to the R6 stage (full seed set). See page 33 for soybean development information.
STINK BUG SCOUTING

Using a sweep net, sample in at least 5 locations in smaller fields, more in larger fields. Stink bugs tend to be more numerous on field edges so sample throughout the field for the overall picture.

At each location take a set of 10 sweeps, taking a step with each sweep of the vegetation. Count the number of stink bugs captured in your sweep net for each 10 sweep set. All pest stink bug species, both adults and nymphs, should be counted together.
If your soybean field is at threshold level, pesticides are an effective method for controlling stink bugs from pod fill (R3) to seeds fully forming (R6). Applications prior to or after this time are not necessary. Always follow the label guidelines and use appropriate rates for stink bugs in soybean.

If you have questions regarding an insecticide label or rate, contact your local extension office for up-to-date advice.

After an insecticide treatment has been made, be sure to scout the field to ensure stink bug populations remain under threshold level.

Green stink bug adult.

Amy Raudenbush, The Ohio State University

Yellow band around abdomen.

Black spots on yellow band around abdomen.

Black bands on antenna.
Key identification characteristics:

- Adults are green with black bands on antenna, a yellow outline with black spots around the abdomen
- Early instars are round, black with orange, yellow and white markings
- Later instars have black wing pads and a green abdomen or are green with a yellow margin around the abdomen
Key identification characteristics:

- Adults have rounded shoulders with a small row of spines and no white banding on the antennae
- Adult underside of abdomen is yellowish-green or pink
- Early instars are round and brown
- Late instars are green with dark stippling on wing pads and brown triangle on abdomen

Brown stink bug 1st instars.

Brown stink bug nymphs.

Brown triangle on abdomen.

Dark stippling on wing pads.

Brown stink bug 5th instar.
There are 2 subspecies and a hybrid of *E. servus*:

**Euschistus servus servus**
- Last two antennal segments are yellowish/reddish brown
- Edge of abdomen not covered by wings

**Euschistus servus euschistoides**
- Last two antennal segments dark brown
- Edge of abdomen covered by wings

**Euschistus servus** hybrid
- Hybrid species as a result of *E. servus servus* and *E. servus euschistoides* mating
Key identification characteristics:

- Adults are brown with pointed shoulders, and males have spots on underside of abdomen

There are two subspecies of *E. tristigmus*:

**Euschistus tristigmus luridus**
- Rounded shoulders
- Red / black antennae

**Euschistus tristigmus tristigmus**
- Spiny shoulders
- Brown / pale antennae
Key identification characteristics:

- Adults are brown with pointed shoulders
- Adult males have one spot on the lower part of the underside of abdomen
- Antennae and legs do not have white bands
- Legs are tan and stippled with brown

Top to bottom: Onesotted stink bug adult; male onesotted stink bug with spot on underside of abdomen.
Brown marmorated stink bug adult.

Black and white pattern on abdomen.

White bands on legs.

White bands on antenna.

Amy Raudenbush, The Ohio State University
Key identification features:

- Adults are brown with white bands on antennae, and black and white banding on abdomen
- Adult wing veins are outlined in black
- 1st instars are orange and black
- 2nd instars are black with white banding on antennae and legs
- 4th and 5th instars are brown and wing pads become visible

BMSB is a recent invasive species first reported in Ohio in 2007.

BMSB adults overwinter indoors, making it a nuisance to homeowners.
Redshouldered stink bug adult.

Red / pink across shoulders.

Red “feet”.

Amy Raudenbush, The Ohio State University
Redshouldered stink bug adults (green and brown) and a 5th instar from the same egg mass.

Key identification characteristics:
- Adults are green or brown
- Green adults may have a red/pink band across the shoulders
- The brown color variant of adults is common in the fall
- Nymphs are tan and black with thin red stripes on the abdomen
RICE STINK BUG  
*OEBALUS PUGNAX*

**Key identification characteristics:**
- Adults are yellow/tan
- The abdomen is elongated and not as wide as other stink bug species
- Shoulders have spines that point towards head

![Rice stink bug adult.](Louis Tedders, Bugwood.org)

TWICE STABBED STINK BUG  
*COSMOPEPLA LINTNERIANA*

**Key identification characteristics:**
- Adults are black with red marking across shoulders and two red marks on shield over the abdomen
- Black antennae and legs
- Smaller than other stink bug species

![Twice stabbed stink bug adult.](Kevin D. Arvin, Bugwood.org)
Key identification characteristics:

- Adults are green with either a white or red/pink spot on shield over the abdomen
- White or pink outline around abdomen
- This species can also be black with an orange or white outline around abdomen

SAY STINK BUG
CHLOROCHROA SAYI

Say stink bug adults mating.

Say stink bug adult.
Key identification characteristics:
- Adults are brown with pointy shoulders
- Legs yellowish to light brown
- Brown mark on tip of wings
- Thicker mouthparts than pest species, twice the thickness of the antenna

Monitoring: This is a beneficial stink bug to have in your field; it is a predatory species! Do not include in threshold counts.
Key identification characteristics:

- Adults vary in colors from white, yellow, orange and red with black legs
- Pattern on shield is similar despite color variation
- Mouthparts twice the thickness of the antenna

Monitoring: This is a beneficial stink bug to have in your field; it is a predatory species! Do not include in threshold counts.
While scouting your fields, you may encounter some other insects that are not stink bugs but look similar.

**STINK BUG LOOK-A-LIKES**

- Greenish/brown color
- Globular body shape
- Currently not a known pest in Ohio

**BURROWING BUG**

- Adults are black with a white margin
- Oblong shaped
- Adults are smaller than most adult stink bug species
- Nymphs are red
- Not an economic pest of soybean

**KUDZU BUG**

- Greenish/brown color
- Globular body shape
- Currently not a known pest in Ohio
STINK BUG
LOOK-A-LIKES

WESTERN CONIFER SEED BUG

• Elongated shield-shaped body
• Leaf like structures on legs
• Not often found in soybean fields

WHEEL BUG

• Adults are predatory
• Oval shaped
• Raised wheel structure on the back
• Thick piercing-sucking mouthparts
Green stem syndrome occurs when soybean plants stay green at a time when the leaves should be maturing (yellowing) and dropping to the ground, thus resulting in delayed maturity. It is thought to be caused by disease, insect injury (such as feeding by stink bugs), and environmental stress during the reproductive stage of soybean plants. Since stink bugs are often found more densely on field edges, green stem syndrome is more prevalent on the edges, though the inner field may mature properly.
Seed injury from feeding

Injury to soybean seeds is caused by stink bugs feeding on the pods with their piecing-sucking mouthparts. Adults and fifth instars are known to cause more injury than smaller instars. From the outside of the pod, seed injury is difficult to see; however, in some cases it can cause noticeable discoloration. Seed injury is much more obvious inside the pod where seeds will appear shriveled, discolored or be aborted.
Levels of seed injury resulting from stink bug feeding

No injury - round and tan seeds.

Moderate injury - noticeable shriveling, slight discoloration and deformation of seeds.

Severe injury - small shriveled and discolored seeds.
Soybean Stages

**VE**
Cotyledon emergence

**VC**
Cotyledons expanded and unifoliolate leaves unrolled (not touching)

**V1**
First trifoliolate leaves unrolled (not touching)

\[ V(n) \]
The number of fully expanded trifoliolates

**R1**
Beginning bloom: open flower at any node on main stem

**R2**
Full bloom: open flower at one of the two uppermost nodes on main stem

Erin Hodgson, Iowa State University
**SOYBEAN STAGES**

**R3**
Beginning pod set: pods <5/16 in. long at four uppermost nodes

**R4**
Full pod set: pods >3/4 in. long at four uppermost nodes

**R5**
Beginning seed set: seed is 1/8 in. long at one of four uppermost nodes

**R6**
Full seed set: green seed that fills pod capacity at one of four uppermost nodes

**R7**
Beginning maturity: one pod on main stem has reached mature color

**R8**
Full maturity: 95% of pods have reached mature color
